SINGLE USE LINEAR CUTTER STAPLER - RELOADING

1. Once the device has been fired and handed back to the Scrub Nurse, the cartridge is removed by lifting up and away from the proximal end of the cartridge housing.

2. With the device empty and in two parts rinse it by immersing it fully in saline/sterile solution. This ensures any fired staples that may remain within the jaws or the anvil are rinsed off.

3. Whilst ensuring the staple protection tab stays on the reload, insert the new cartridge into the device by positioning it at the distal end of the device (tapered end of the reload).

4. Ensure the cartridge is securely housed in the device by pressing down firmly from the distal end to proximal end.

5. Remove the staple protection tab immediately prior to handing the device to the Surgeon. If possible, ask the Surgeon to remove this themselves prior to firing.

NOTES

- Cartridge sizes can accommodate the following tissue thickness: Blue = 1.5 mm, Green = 2.0 mm
- The device can be reloaded a further 7 times, marking a total of 8 firings.
- The device is available in a 60mm and 80mm. All reloads are interchangeable within the same size group.
